

Algorithm

↳ It is step by step procedure to perform specific task

English

Task
① Add two numbers

mathematic

$$\begin{array}{r} 3 + 7 = 10 \\ (a) + (b) = \text{sum} \end{array}$$

⇒ program code

→ Read → (python dx)
→ Display/write/print

Real example

Coffee

⇒ cup
⇒ water boil
⇒ sugar add
⇒ milk
⇒ spoon stir

Step 1: Start

Step 2: Take a cup, water, coffee powder, sugar, and milk

Step 3: Boil water

Step 4: Add 1-2 spoons of coffee powder into the cup

Step 5: Add sugar as per taste

Step 6: Pour hot water into the cup and stir well

Step 7: Add milk (optional, if making milk coffee)

Step 8: Stir properly

Step 9: Serve the coffee

Step 10: Stop

a, b
→ sum = a + b
→ sum

Step 1: Start

Step 2: Take a, b variables

Step 3: Read a, b values

Step 4: Compute: sum = a + b

Step 5: Display sum value

Step 6: stop

② Average of three values

② Avg of three value's

I II ⊗

$$\frac{(3+5+10)}{3} = \text{avg}$$

Sum = 3 + 5 + 10
Avg = sum / 3
Display Avg

Step 1: start

Step 2: Take a, b, c, variable's

Step 3: ^{input} Read a, b, c, value's

Step 4: compute: $\text{Avg} = \frac{(a+b+c)}{3}$

Step 5: Display Avg value.

Step 6: stop

Characteristics

Input → It should accept zero or more inputs.

Output → It should produce at least one output.

Definiteness → Every step must be clear and unambiguous.

Finiteness → It must end after a finite number of steps (not run forever).

Effectiveness → Steps should be basic, simple, and feasible.

Generality → It should be applicable to a class of problems, not just one case.

Coffee

→ mixing — Drinking

→ bill

→ Take cup

Rules:

Start and End should be clearly mentioned.

Steps must be numbered and sequential.

Use simple English statements (not code).

Maintain clarity and correctness.

Ensure finite execution (the algorithm should not loop infinitely).
